

Let the distance in inches from the left edge of the page to the vertical line be H, and from the bottom edge to the horizontal line be V; let the lengths of the gaps at the top and bottom of the vertical line be T and B respectively, and the gaps at the left and right of the horizontal line be L and R. For correct alignment of pages, put the following line in a file named (for example) margins.ps, and then mention margins.ps on the gs command line when printing any of your own files:

```
<< /.HWMargins [ml mb mr mt] /Margins [x y] >> setpagedevice
```

where

$$\begin{aligned} ml &= L * 72, mb = B * 72, mr = R * 72, mt = T * 72, \\ x &= (1 - H) * 720.0, y = (V - 1) * 720.0 \end{aligned}$$
